

VLD for Windows

Secure Software for the RTR-5 Series

Create and Retain Validated Data Records for CFR 21 Part 11 Compliant Reporting Systems

T&D Recorder VLD for Windows Software

VLD-RTR5

T&D Recorder VLD for Windows is a software solution for companies that need to meet the FDA's CFR 21 Part 11 requirements for tamper proof electronic record keeping. VLD for Windows facilitates the creation of validated data files downloaded from TandD's RTR-57 Data Collector that have been gathered from RTR-5x series wireless dataloggers, and also from TandD's TR-5x loggers. Logging sessions are downloaded to a PC as secure, encrypted files with electronic signature access control. VLD for Windows also maintains a complete record of data base access for audit trail tracking and reporting.

Secure Administrator Mode

VLD for Windows primary point for access and control is the Secure Administrator function. User ID and Password protected, the administrator mode allows for access to all of the software's functions and is the point from which other users can be added and deleted, permissions granted and configurations can be set.

Configurable User Permissions

User permissions can be individually configured. This allows the administrator to grant each user access to only those functions that they need. For example, some users might be allowed to view data, but not to modify it. Or, expiration periods on user passwords can be set.

Archive Viewer

VLD for Windows includes an Archive View module that allows authorized users to view the software transaction history. This provides for a complete audit trail documenting when data was collected, accessed, by whom, and what changes were made.

Also create validated records of data collected from TandD's TR-51A and TR-52 photo-optically read Data Loggers.

Secure Logger Configuration

All RTR-5x data logger functions are configured within the VLD for Windows software package. This means that only authorized users can perform such functions as device registration, or can establish recording sessions and set parameters.

Tamper Proof Files

Downloaded data records are maintained in encrypted format. VLD for Windows allows access to secure files only with the user ID and password that was used to create them. Unauthorized attempts at access or manipulation of any secure file will result in it being locked.

Temperature Humidity Graph VLD

Within the VLD for Windows package is a secure version of Temperature Humidity Graph. This is TandD's versatile software that allows for viewing and printing of data in graphical and tabular format. Only authorized users with permission from the administrator can access this module.
