

RTR-50

Wireless Data Collector & Repeater USB Connected Base Station with Battery Powered Repeater Mode

The RTR-50 is TandD's newest Data Collector for the RTR-5x series of wireless Data Loggers. This USB connected base station is compatible with all RTR-5x series loggers, and connects directly to a PC through the integrated USB port. The included software supports in-demand functions such as scheduled downloads, real-time monitoring and e-mail alarm notification. Remarkable for a unit of this size and cost is the integrated repeater mode. The RTR-50 can be set by software to function as a daisy-chainable repeater that can render wireless range problems a thing of the past.

T&D Corporation

Wireless Data Collector & Repeater

A single system solution for virtually any application!

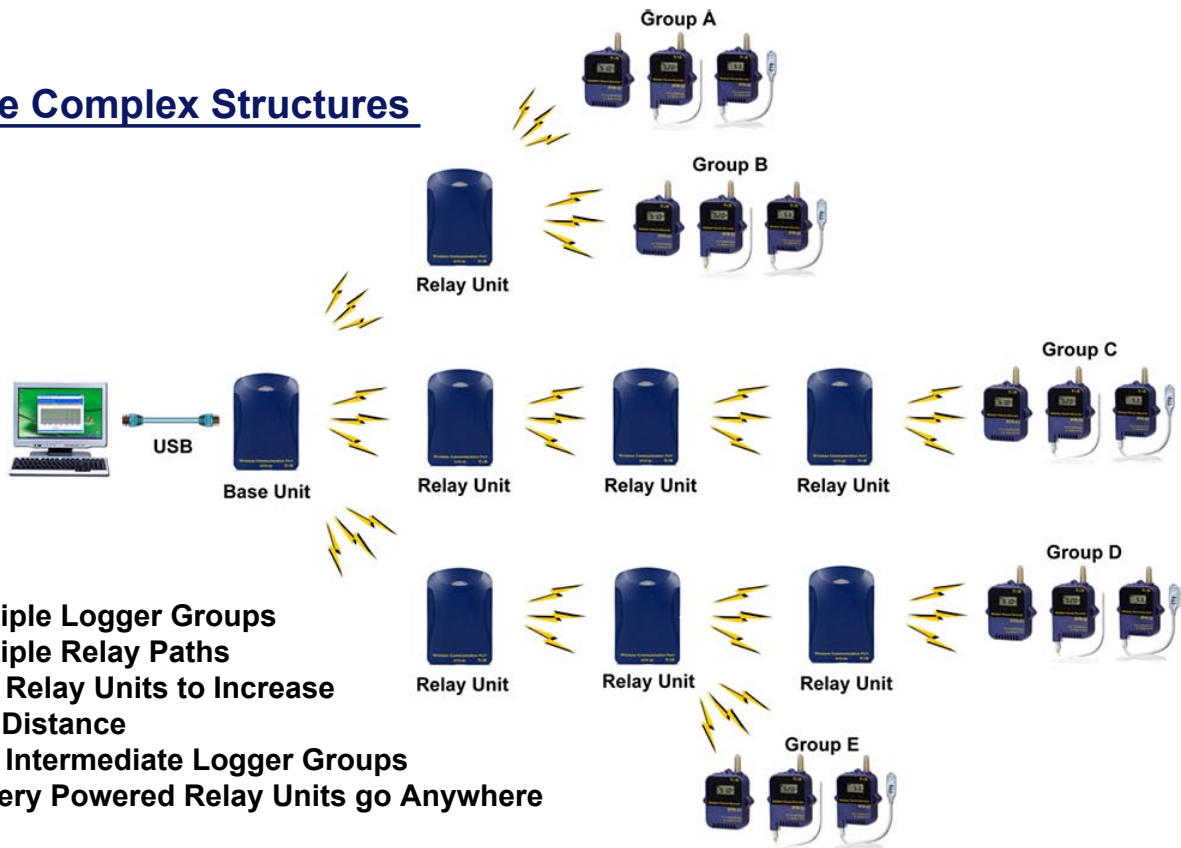

The RTR-50 offers unprecedented flexibility in configuring site-specific solutions. Best of all, range and distance problems, which have always been an issue in wireless applications, are now a thing of the past! Systems can range from a cost effective single base station and a single logger, to complex "tree" structures that can be configured to virtually any physical arrangement.

A Very Simple System

- TandD's most cost effective wireless solution

Create Complex Structures

- Multiple Logger Groups
